

Turn On Your Zoom App: Add Scopes & Activate

You already created your **Server-to-Server OAuth** app and sent us the 3 keys. 🎉

Now do these **2 last steps** so ONTACT can create your class meetings automatically. Takes about 3 minutes.

Why this matters

Your keys are correct, but the app also needs **permission to create meetings** and must be **turned on (Activated)**. Without these two things, ONTACT cannot open meetings on your account — so please finish both steps below.

Before you start

- Use a **computer** (not the phone app).
- Go to **marketplace.zoom.us** and **Sign In** with your Zoom email & password.
- Open your app: top-right **Develop** → **Build App**, or **Manage** → **Created Apps**, then click your app (e.g. **ONTACT Class**).

Step A — Add **Scopes** (permissions)

1 Open the “Scopes” tab

On the left menu of your app, click **Scopes**.

2 Click “+ Add Scopes”

A search box will appear.

3 Search “meeting” and add the meeting permission

Type `meeting`, then check the box that lets you **create / manage meetings**. Depending on your account it is named:

- `meeting:write:admin` — “View and manage all user meetings”, or
- `meeting:write:meeting:admin` — “Create a meeting for a user” (newer accounts)

✓ If you see both, add both. The important word is **meeting** + **write**.

4 (Recommended) Search “user” and add user read

Type `user` and check `user:read:admin` — “View users”.

5 Save

Click **Done**, then **Continue** (or Save) at the bottom.

You do **not** need to re-send us the keys. The keys stay the same — you are only turning on permissions.

Step B — **Activate** your app

1 Open the “Activation” tab

On the left menu, click **Activation** (sometimes shown as the last step).

2 Click “Activate your app”

Press the **Activate your app** button.

3 Check the status

The status should now say “**Activated**” (green). Done! 

 When your app shows **Activated** and has the **meeting** scope, ONTACT can create your meetings automatically.

Common mistakes (please double-check)

Problem	Fix
App is not activated	Do Step B (Activation → Activate your app)
No meeting scope	Do Step A (add <code>meeting:write:admin</code>)
Client ID copied wrong (missing last letter)	Copy the <u>full</u> Client ID again and re-send it. It is usually 22 characters .
Wrong app type	It must be Server-to-Server OAuth — not “OAuth”, “SDK”, or “Webhook”.

 **Tip for copying keys:** select the whole value by triple-clicking it, or use the **Copy** button next to it — don’t type it by hand, so no character is lost.

What to send us

If you had to re-copy your **Client ID** (or any key), please send us the corrected value. Otherwise, once your app is **Activated** with the **meeting** scope, you’re all set — no need to send anything again. Thank you! 🙌
